## CORROSION AND MOISTURE PROTECTION with Foil Packaging

Corrosion is a significant problem in the handling, storage and shipping of products. Corrosion of sensitive parts, products or equipment in transit is one of the leading causes of damage claims by shippers, and product rejection by end users. Humidity and moisture are invisible yet destructive elements that can contribute to the rapid deterioration of many products in transit.

### How To Prevent Corrosion

There are different solutions for protecting your products from corrosion depending on parameters such as product type, means of transportation, and the length of the transit time. CMTP's corrosion and moisture-resistant foil packaging solutions are ideal for protecting fragile and sensitive goods from all types of moisture damage in any climate. Suitable for industries such as marine, mining, automotive, defence and manufacturing.

Long and short-term storage of delicate products demands special corrosion prevention, moisture and rust protection in tough climatic conditions, and can be particularly critical for manufacturers of:

- ✓ **Chemicals and explosives**
- ✓ **Machinery, machine parts and equipment**
- ✓ **Hazardous waste products**
- ✓ **Pharmaceutical products**

### Our Corrosion and Moisture Protection products include:

- ✓ **Heat shrinkable foils and films**
- ✓ **Heat sealable foils and films**
- ✓ **Desiccants and rust preventative sprays and liquids**

CMTP uses high quality corrosion and moisture protective products to ensure that the packaging solution achieves the required protection. Whatever the size or shape of your product we can manufacture a complete cover and vacuum seal it to totally protect against sea air, moisture water, water vapour, acids and corrosive matter.
