Packaging Design & Engineering Services Cost-Effective Designs And Engineering Solutions

The CMTP team has years of experience in designing packaging for everything from fresh fruit bins and potato bins, packaging for wine boxes and auto parts, to livestock crates and flute board seafood containers – right through to export crates for small and large scale machinery moves.

An integrated process for optimised packaging solutions

Our design process is rigorous, taking into account all aspects and steps of packing, storing, shipping, retailing and using your product. We can then recommend the smartest solution that meets both your needs as manufacturer, producer or distributor along with the needs of your customers.

After developing a conceptual image, CMTP can make an off-tool prototype for your consideration and to help you plan. The designs can represent concepts from the basic to the most complex integration of packaging substrates.

CMTP's design service is not constrained by a limited selection of materials. We work with all forms of packaging materials, including cardboard, timber, CMTP Flute Board, polyethylene and polyurethane foams, steel, aluminium, plywood, medium-density fibreboard and heavy-duty cardboard

CMTP's design, engineering and development services team provides:

- ✓ Product packaging design
- ✓ Barcode labelling
- ✓ Packing systems for shipping containers
- ✓ Airfreight packing solutions
- ✓ In-house or on-site packing consultations

Expertise and down-to-earth common sense are critical in achieving the best results, along with understanding the diverse needs of Australian industries, the complexities of protecting products through multiple modes of transport and conditions, and knowing the capabilities of many materials.
